Discover. Learn. Empower.

ASSIGNMENT NO:-..1..

Subject: Frontend tech

Subject Code: 25CAH-655

Submitted By:

Name: Swayam

UID: 25MCA20015

Branch Sec: MCA-1/A

Submitted To:

Mr. Juned alam

1. What is Figma? Explain its key features and why it is widely used in modern UI/UX design.

Figma is a cloud-based interface design tool used to create digital products such as mobile apps and websites.

It runs directly in the browser, so users do not need powerful hardware or heavy installations.

One of its most important features is real-time collaboration, allowing multiple designers to work on the same file.

It supports UI design, wireframing, prototyping, and developer handoff in one platform.

Design files are stored online, making sharing and version control very simple.

Figma also provides plugins and community resources that speed up workflow.

Because of its accessibility, collaboration, and versatility, it has become extremely popular in modern UI/UX design.

2. Differentiate between Designing and Prototyping in Figma. Explain with one real-world UI example.

Designing in Figma focuses on the visual appearance of a screen, including layout, colors, typography, and icons.

It defines how the interface looks and how elements are positioned.

Prototyping is about adding interactions, transitions, and navigation between screens.

It simulates how a user will experience the product without writing actual code.

For example, when creating a food delivery app, designing involves building the home screen and menu layout.

Prototyping then links buttons like "Order Now" to the checkout screen.

In simple terms, designing creates the static visuals, while prototyping creates the interactive experience.

3. What are Components and Styles in Figma? How do they help in maintaining consistency and saving time in large projects?

Components are reusable UI elements such as buttons, headers, or cards that can be used across multiple screens.

When the main component is edited, all instances update automatically.

This prevents repetitive work and ensures uniform design changes.

Styles are predefined visual attributes like colors, text formats, and effects.

4. Explain Auto-Layout in Figma. How does it help in creating responsive designs for different screen sizes?

Auto-Layout is a feature that automatically arranges and resizes elements based on content.

Instead of manually adjusting spacing, designers define rules for padding and alignment.

When text or objects change, the layout adapts dynamically.

This makes UI elements flexible and easier to maintain.

It is especially useful for responsive designs across devices.

For example, a button can expand when the label text becomes longer.

Auto-Layout helps create scalable and adaptive interfaces with less manual effort.

[Frame with Auto-Layout]

[Item 2]
[Item 3]

Add Item 4 → Layout adjusts automatically

5. Describe the complete developer handoff process in Figma. How are designs shared, assets exported, and code snippets generated for developers?

Developer handoff in Figma is the process of transferring design details to engineers for implementation.

Designers share files using links, giving developers view or inspect access.

Developers can check measurements, spacing, colors, and fonts directly.

Assets like images and icons can be exported in formats such as PNG or SVG.

Figma automatically provides code snippets like CSS properties for reference.

This reduces confusion between designers and developers.

Overall, the process improves communication and speeds up product development.
